Thermanator: Thermal Residue Attacks

A Common Scenario:

- **1.** You arrive at work (shared workspace)
- 2. Go to your desk & workstation
- 3. Enter password (userid is often implied)
- 4. Get bored waiting for login process to finish
- 5. Look at screen, maybe click the mouse a few times
 - **6a.** A colleague calls you to a meeting or for coffee

OR

6b. You step away on your own (to bathroom, coffee, etc.)

7. Being security conscious, you might even lock the screen

Any Problems?

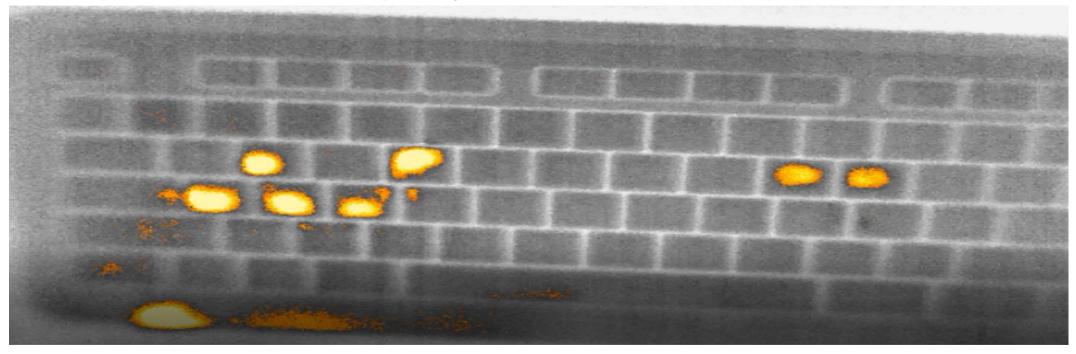

You didn't wear oven mitts!

Why wear oven mitts?

(or any other thermal-insulator)

♦ Most modern external keyboards are made of plastic
♦ Poor conductor → retains heat for a while...

Related Work

- Mainly focused on recovering PINs
- First work by Zalewski on cracking safes (2005)
 - Mowery, et al. (2011)
 - Wodo and Hanzlik (2016)
- Mobile devices (screen-lock patterns)
 - Androitis, et al. (2013)
 - Abdelrahman, et al. (2017)
- No systematic investigation of thermal residues on external keyboards

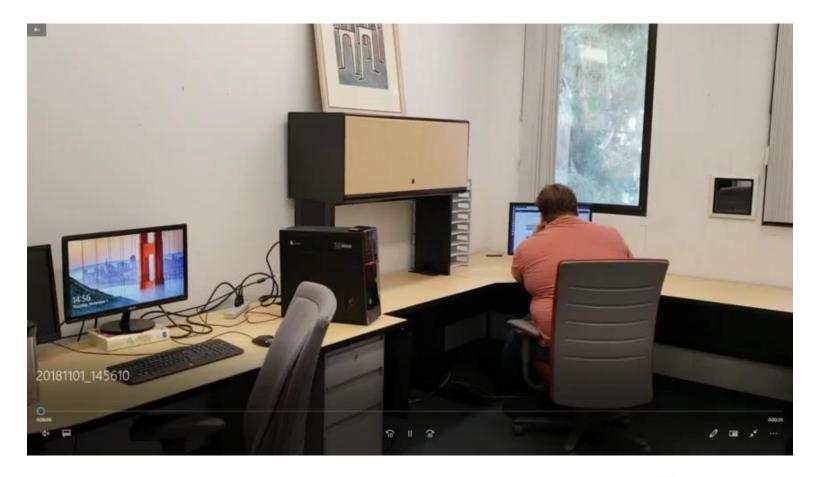

Thermanator aka "Coffee-Break" Attack

Two Flavors:

- **Opportunistic:** victim steps away on own accord
- Orchestrated: accomplice distracts and/or lures away

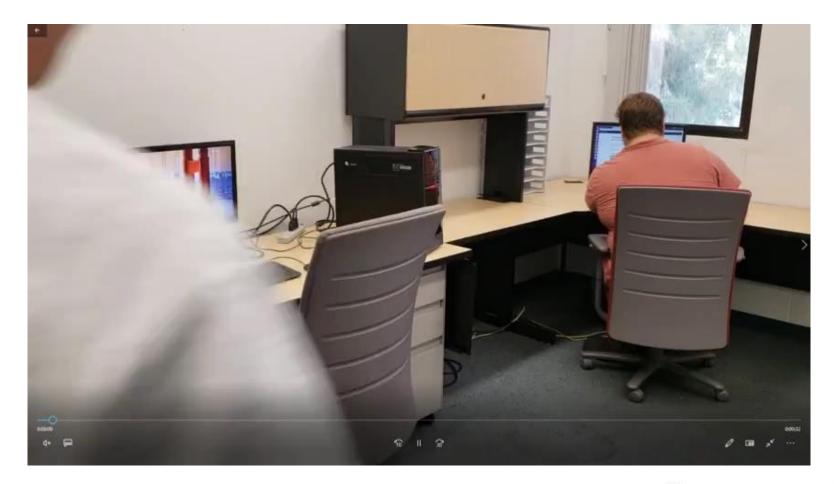

Opportunistic Thermanator Attack

Orchestrated Thermanator Attack

Questions:

- How dangerous are thermal side-channel-based attacks?
- What is the realistic attack window?
- What does attack's success require?
 - User physical attributes (e.g., fingertip size/shape)
 - Password strength (weak or strong)
 - Typing style (hunt-and-peck vs. touch typing)
 - Keyboard type (brand and model)

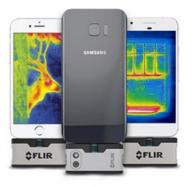

When in doubt, experiment!

Attacker Equipment:

- Mid-range thermal camera (FLIR SC620)
- Cost around \$1,500 (used)
- Thermal imaging frequency: **1 Hz**

Note: to "un-initiated", looks like a regular video camcorder.

FLIR One

A6700sc

X8500sc

Model	Price	Capabilities	Model	Price	Capabilities
FLIR One	US\$300	Sensitivity: 0.15K. Accuracy: ±1.5K or 1.5% of reading. Resolution: 50x80. Image Capture: Manual, 1 image at a time. Video Capture: None	A6700sc	US\$25,000	Sensitivity: 0.018K Accuracy: ±2K or 2% of reading. Resolution: 640x512. Image Capture: Automatic, up to 100fps. Video Capture: Up to 100fps.
SC620	US\$1,500 (used)	Sensitivity: 0.04K Accuracy: ±2K or 2% of reading. Resolution: 640x480. Image Capture: Automatic, 1fps Video Capture: None.	X8500sc	US\$100,000	Sensitivity: 0.02K Accuracy: ±2K or 2% of reading. Resolution: 1280x1024 Image Capture: Automatic, up to 180fps. Video Capture: Up to 180fps.

Experimental Setting

Experiments: STAGE I

- ✓ Recruited 31 subjects, mixed gender, college-age
- ✓ Each entered 10 passwords:
 - Weak: "password", "football", "iloveyou", "12345678", "12341234", "passw0rd", and "jordan23"
 - **Strong:** "jxM#1CT[", "3xZFkMMv|Y", and "6pl;0>6t(OvF"
- ✓ Images taken every second, up to 1 minute after entry

Four Popular Keyboards (plastic)

HP SK-2023

AZiO Prism KB507

¥BHEU / @BLACK HAT EVENTS

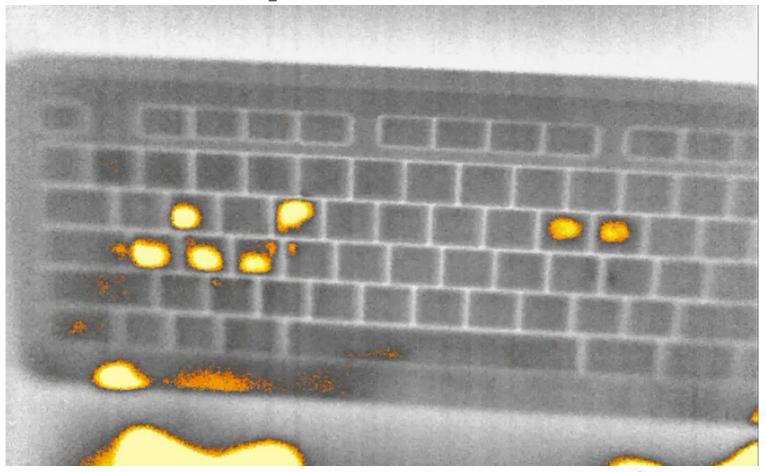

Dell SK-8115

Logitech Y-UM76A

Sample "Video"

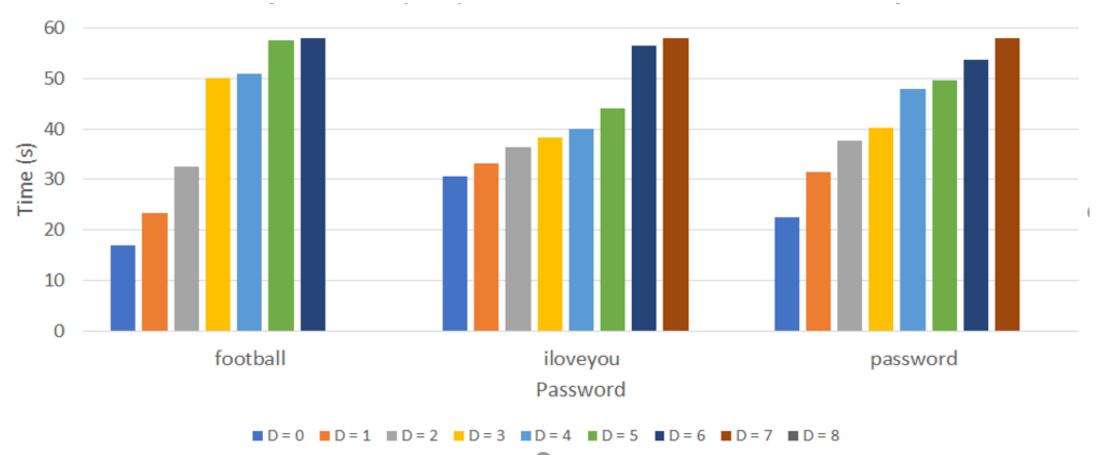

Experiments: STAGE II

- 8 non-expert subjects acted as adversaries
- Each shown 150 thermal recordings in random order
- Asked to identify "lit regions"
 - **NOT** asked to guess passwords

Results - Alphabetical "Insecure" Passwords

D = Number of missed + mis-identified keys

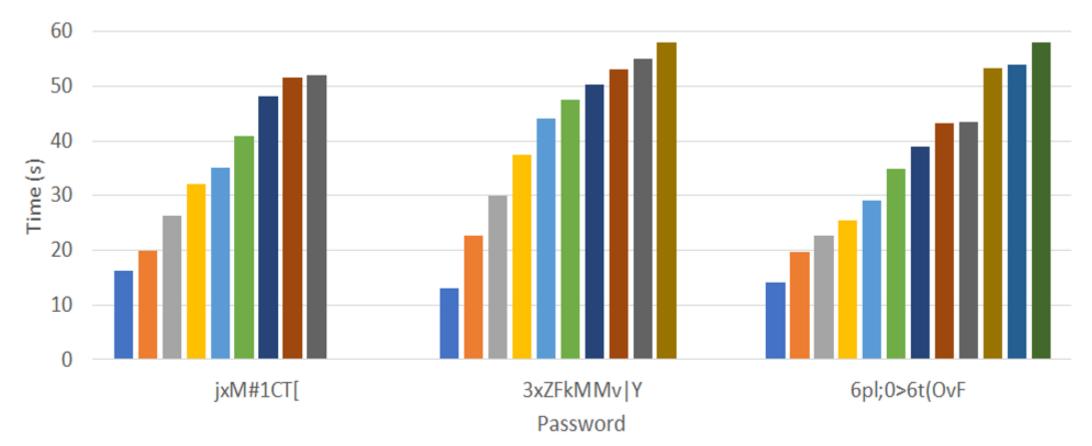

Results - Alphanumeric "Insecure" Passwords

■ D=0 ■ D=1 ■ D=2 ■ D=3 ■ D=4 ■ D=5 ■ D=6 ■ D=7 ■ D=8

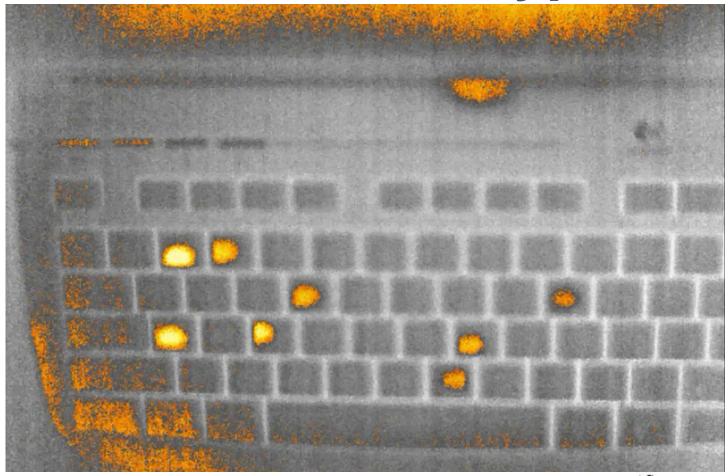

Results - "Secure" Passwords

■D=0 ■D=1 ■D=2 ■D=3 ■D=4 ■D=5 ■D=6 ■D=7 ■D=8 ■D=9 ■D=10 ■D=11

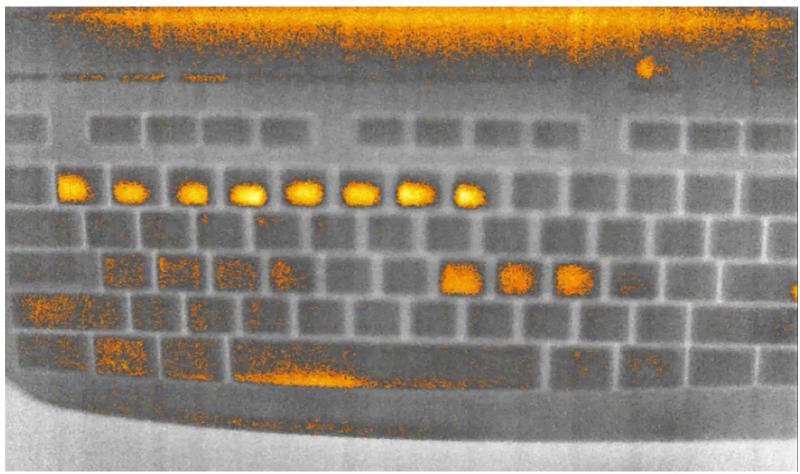

Hunt-and-Peck Typists

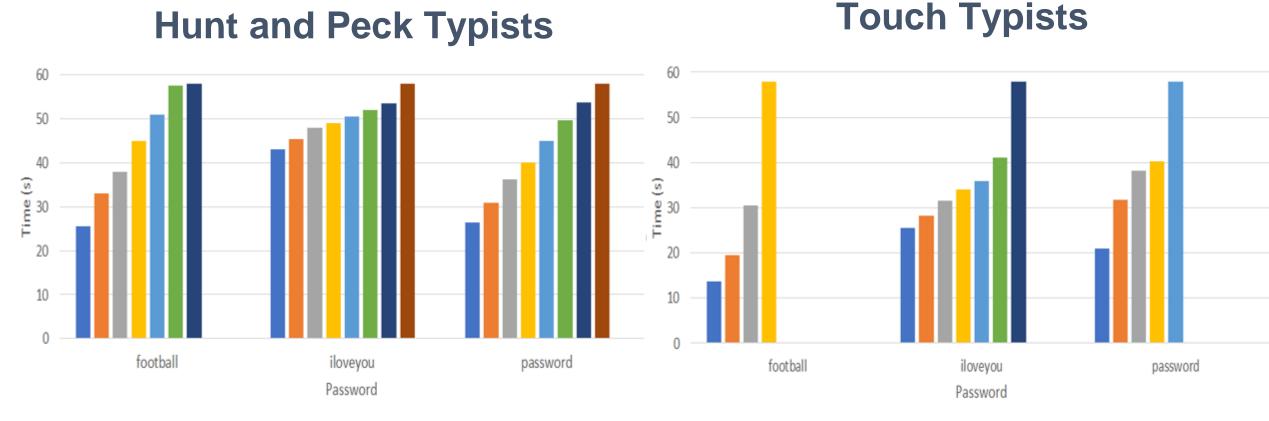

Touch Typists

Results – Alphabetical "Insecure" Passwords

[■]D=0 ■D=1 ■D=2 ■D=3 ■D=4 ■D=5 ■D=6 ■D=7 ■D=8

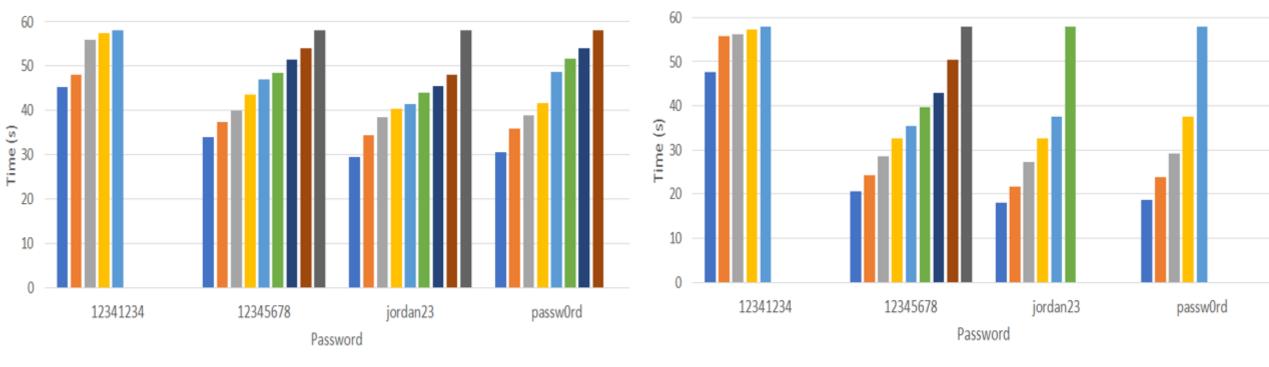

■D=0 ■D=1 ■D=2 ■D=3 ■D=4 ■D=5 ■D=6 ■D=7 ■D=8

Results – Alphanumeric "Insecure" Passwords

Touch Typists

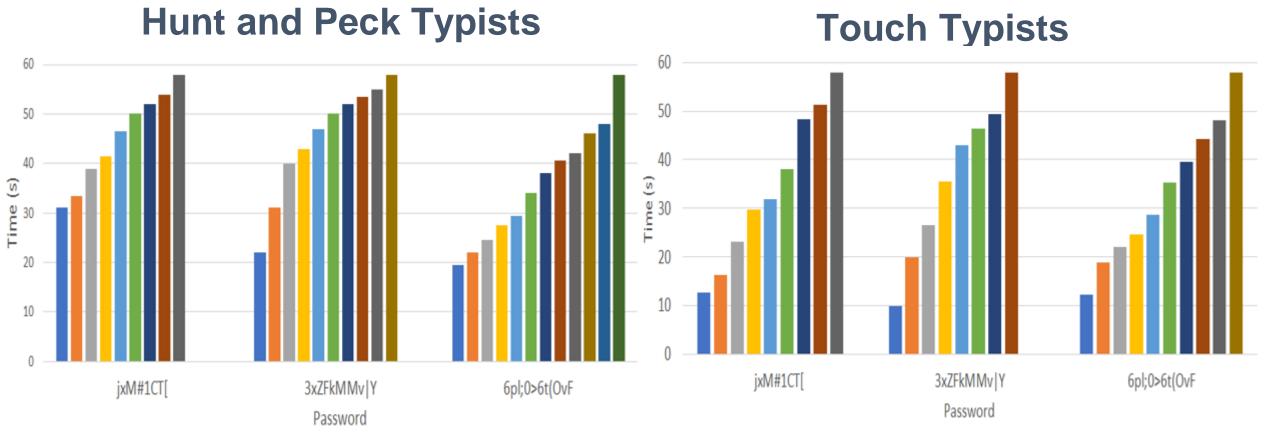

■ D=0 ■ D=1 ■ D=2 ■ D=3 ■ D=4 ■ D=5 ■ D=6 ■ D=7 ■ D=8

■ D=0 ■ D=1 ■ D=2 ■ D=3 ■ D=4 ■ D=5 ■ D=6 ■ D=7 ■ D=8

Results – "Secure" Passwords

■D=0 ■D=1 ⅢD=2 ■D=3 ■D=4 ■D=5 ■D=6 ■D=7 ■D=8 ■D=9 ■D=10 ■D=11

■D=0 ■D=1 ■D=2 ■D=3 ■D=4 ■D=5 ■D=6 ■D=7 ■D=8 ■D=9

Results

Password recovery:

- Entire set of key-presses as late as 30 seconds
- Partial sets up to 1 minute

Typing style:

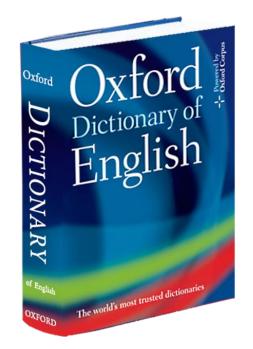

- Hunt-and-peck typists especially vulnerable

Order:

- No reliable key-press ordering information
- Possible reasons: pressure, timing and area differences of fingers/presses
- Good news: We have dictionaries!!!

Mitigation

How to prevent or inhibit Thermanator attacks?

- Chaff typing (need dedicated on-screen scratchpad)
- Keyboard-less entry (touchscreen, mouse-based)
- Move away from passwords altogether
- ♦ Long acrylic nails, gloves or oven mitts ☺

Black Hat Sound Bytes

 Using (plastic) keyboards to enter passwords is even less secure than previously recognized

2 Post factum thermal imaging attacks are realistic

③ We should either stop using keyboards for password entry or abandon passwords altogether.
